read-only data definitions
display_devbyaddr -- display UCB, etc. given its address
display_device -- display i/o data structures
parse_device -- parse device name into name and unit number
show_ddbs -- display device data blocks (DDBs)
get_ddb -- locate the next DDB in the I/O database
show_controller, Display controller information
show_controller tables & action routines
show_system_block, show system/path blocks (SB/PB)
show_system_block tables & action routines
show_ucb, show unit control block (UCB)
get_ucb, copy UCB to local storage
show_ucb tables & action routines
show_ioq, Display I/O queue for device
show_acpq, display acp queue
volume control block tables & action routines
print_cdrp, print a single CDRP block
print_irp, print a single IRP block
show_vcb, Display Volume Control Block (VCB)
volume control block tables & action routines
show_cddb, Display Class Driver Data Block (CDDB)
                                                                                                                                                       storage definitions
```

System Dump Analyzer

Abstract

This module contains routines to print device data structures for the i/o subsystem.

Environment

Native mode, User mode

Author

Tim Halvorsen, July 1978

Modified by

V03-011 EMB0110 Ellen M. Batbouta 24-Jul-1984 Fix a typo in the SHOW DEVICE display and update the list of devices and device characteristics.

V03-010 EMB0105 Ellen M. Batbouta 07-Jun-1984 Add routines to display the contents of the class driver data blocks (CDDB) when displaying an mscp served device. Also for mscp served devices check 2 additional queues before drawing the conclusion that the io request queue is empty. Fix a minor bug and include the node name in the display in the routine, SHOW_SYSTEM_BLOCK.

V03-009 EMD0082 Ellen M. Dusseault 12-Apr-1984
Print the address of the cddb and the alternate cddb
(if the device is mscp served) when displaying the ucb tables
and action routines. Also display the reasons to wait
count for mscp served devices.

V03-008 LMP0221 L. Mark Pilant, 30-Mar-1984 11:53 Change UCB\$L_OWNUIC to ORB\$L_OWNER and UCB\$W_VPROT to ORB\$W_PROT.

V03-007 EMD0059 Ellen M. Dusseault 07-Mar-1984 Fill in local ucb with zeroes in routine, GET_UCB, just in case next ucb fetched is shorter than the previous one.

V03-006 WHM0002 Bill Matthews 16 Feb-1984 Change IDB\$B_COMBO_VECTOR back to IDB\$B_VECTOR.

V03-005 TMK0002 Todd M. Katz 29-Jan-1984 Add DTS_NI to the table BUS_TYPE.

V03-004 WHM0001 Bill Matthews 16-Jan-1984 Change IDB\$B_VECTOR to IDB\$B_COMBO_VECTOR.

                                                                                                                                                     (5)
                                                      .sbttl display_devbyaddr -- display UCB, etc. given its address
                                                      display_devbyaddr
                                                      This routine takes the address value in TPA$L_NUMBER(AP),
                                                      attempt to use it as a UCB address, and do a SHOW DEVICE for that UCB. This is the primary support routine for the SHOW DEVICE/ADDR command.
                                                 Inputs:
                                                      AP = pointer to TPARSE block
                                                 Outputs:
                                                      The i/o data structures for that device are shown.

                                                                                                VAX/VMS Macro V04-00 [SDA.SRC]DEVICE.MAR; 1
                                                .sbttl show_controller tables & action routines
                                          The following are all PRINT_COLUMNS action routines for the show
                                         controller displays.
                                            Action Routine Inputs:
                                                R2
R5
R7
                                                                    value from the COLUMN_LIST entry size of value section for this item
                                                                    address of a descriptor for a scratch string in which the FAO converted value is to be returned
                                                R11
                                                                    base address of the local UCB copy
                                            Action Routine Outputs:
                                                RO
                                                                        lbs ==> use this entry
                                                                        lbc ==> skip this entry
                                                R1 - R5
                                                                    scratch
                                                                    all other registers must be preserved
                                        FAO control strings, etc. used by the action routines
                                                .save

.sbttl volume control block tables & action routines
      The following are all PRINT_COLUMNS action routines for the show_vcb
      block displays.
          Action Routine Inputs:
                                                value from the COLUMN_LIST entry size of value section for this item
                                                address of a descriptor for a scratch string in which the FAO converted value is to be returned base address of the local UCB copy
                R11
          Action Routine Outputs:
                                                       lbs ==> use this entry
                                                       lbc ==> skip this entry
                R1 - R5
                                                 scratch
                                                 all other registers must be preserved

The working set limit was 3000 pages.
381141 bytes (745 pages) of virtual memory were used to buffer the intermediate code.
There were 190 pages of symbol table space allocated to hold 3185 non-local and 393 local symbols.
2914 source lines were read in Pass 1, producing 108 object records in Pass 2.
69 pages of virtual memory were used to define 64 macros.

Macro library statistics

Macro library name Macros defined _\$255\$DUA28:[SDA.OBJ]SDALIB.MLB;1 \$255\$DUA28:[SYS.OBJ]LIB.MLB;1 _\$255\$DUA28:[SYSLIB]STARLET.MLB;2 TOTALS (all libraries) 2021

3409 GETS were required to define 55 macros.

DEVICE

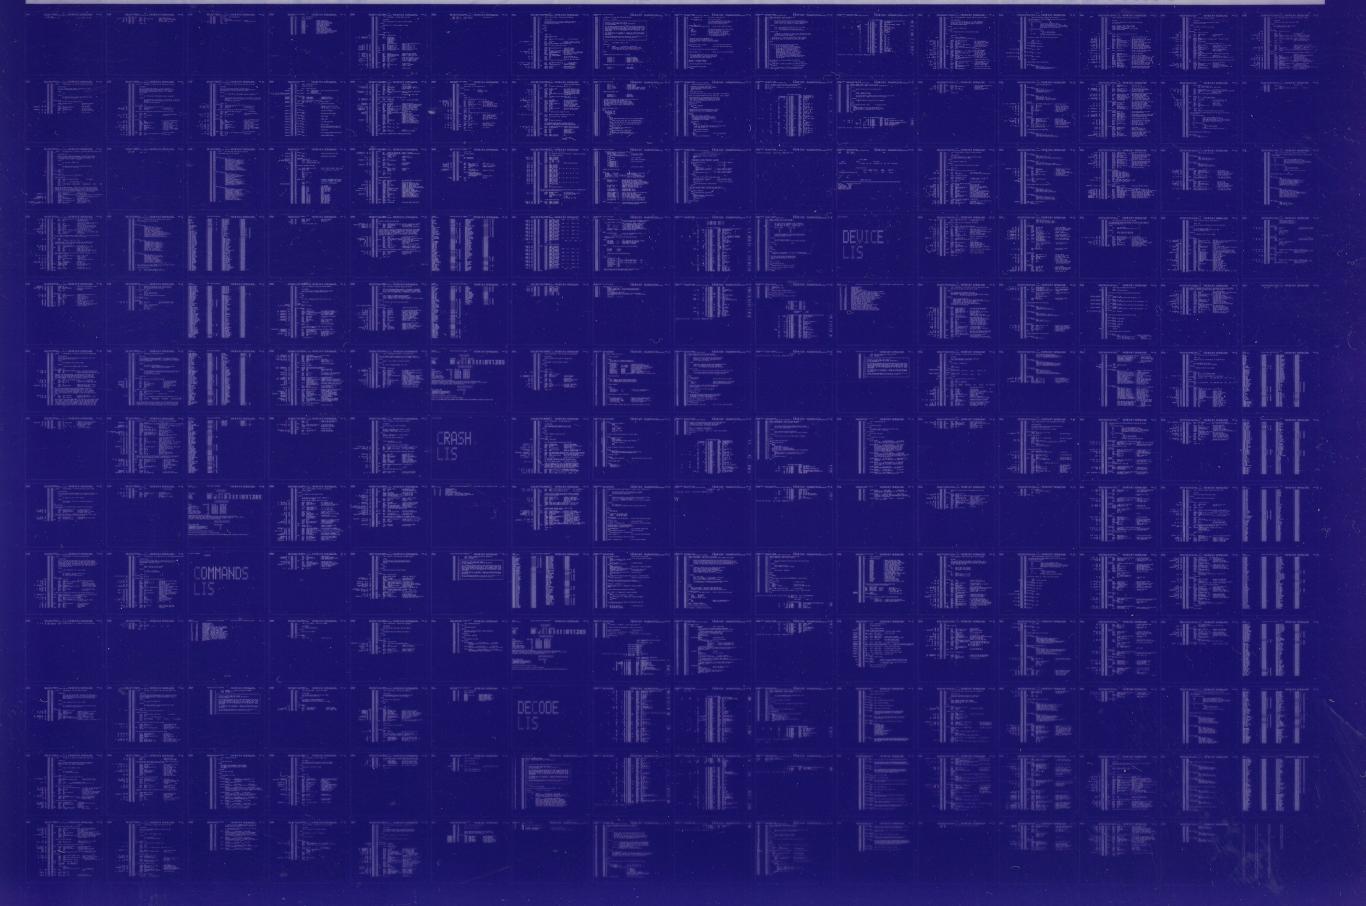

Psect synopsis

There were no errors, warnings or information messages.
